

Logiciel

# Pro-ftpd : un serveur FTP open source pour Linux

## Introduction

**ProFTPD** est un serveur FTP/SFTP/FTPS open source, modulaire et puissant.

- Il gère les répertoires cachés, les hôtes virtuels et les fichiers **.ftpass** par répertoire.
- La structure interne des répertoires anonymes FTP est quelconque (pas besoin de bin, lib ni de fichiers spéciaux).
- Il gère les fonctionnalités avancées (plusieurs fichiers de mots de passe, ratios téléchargement/envoi, etc.).

## Pré-requis

## Installation

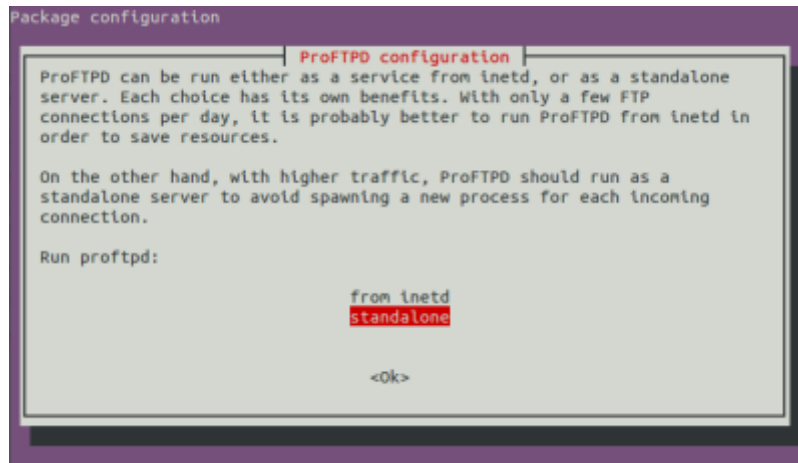

Pour utiliser une authentification sur une base de données, installez les paquets **proftpd-mod** suggérés correspondants.

Installez les paquets  **proftpd,ftp** ou (cas d'un Raspberry Pi) :

```
...@...:~$ sudo apt install proftpd ftp
```

- **ftp** pour les tests
- Lors de l'installation, il peut vous être demandé comment ProFTP doit être démarré. Choisissez **autonome (standalone)** :

- Vous pouvez installer aussi les paquets  **proftpd-mod-ldap, proftpd-mod-mysql, proftpd-mod-odbc, proftpd-mod-pgsql, proftpd-mod-sqlite, proftpd-mod-geoip** ou

```
...@...:~$ sudo apt install proftpd-mod-ldap proftpd-mod-mysql proftpd-mod-odbc proftpd-mod-pgsql proftpd-mod-sqlite proftpd-mod-geoip
```

- L'installation crée les utilisateurs système suivants :
  - **proftpd** (UID 127), groupe **nogroup** ; pas de répertoire personnel **/run/proftpd**.
  - **ftp** (UID 128), groupe **nogroup** ; création du répertoire personnel **/srv/ftp** »...

## 2. Vérifiez que ftp fonctionne sous l'utilisateur en cours (**pi** pour un Raspberry Pi) :

```
...@...:~$ ftp localhost
...
Name (localhost:xxxxxxx):
331 Mot de passe requis pour xxxxxxx
Password:
230 Utilisateur xxxxxxx authentifié
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> ls
...
drwxrwxr-x  4 xxxxxxx  xxxxxxx  4096 Sep  5 05:39 Bureau
...
226 Téléchargement terminé
ftp> bye
221 Au revoir.
...@...:~$
```

- 3. Si vous essayez avec un client comme **Filezilla**, vous constaterez que l'utilisateur n'est pas bloqué dans son home.

## Configuration

 • L'installation a créé l'arborescence :

```
...@...:~$ tree -d /etc/proftpd/  
/etc/proftpd/  
└─ conf.d
```

ou pour un Raspberry Pi :

```
pi@framboise:~ $ tree -d  
/etc/proftpd/  
/etc/proftpd/  
└─ conf.d
```

- **Pour le listing des fichiers de la distribution,** voir [ProFTPd : Fichiers de la distribution](#)

- Pour que les réglages persistent après les mises à jour, nous ne toucherons pas au fichier **/etc/proftpd/proftpd.conf**.
- Nous placerons dans le répertoire **/etc/proftpd/conf.d/** des fichiers contenant nos directives de configuration. Ces fichiers ne seront pas affectés par les mises à jour.
- Liste des directives : <http://www.proftpd.org/docs/directives/linked/by-name.html>

## Utilisateurs virtuels

Chaque utilisateur a accès à son propre répertoire personnel **/home/xxxxxxx** (ou **/home/pi** pour un Raspberry Pi).

- Unix ne connaît que les UID : il n'utilise pas les noms d'utilisateurs.
- **proftpd** ne fait donc pas de différence entre un utilisateur système et un utilisateur virtuel : ils sont définis par leur UID.
- Un **utilisateur virtuel** est un utilisateur qui n'est pas défini dans le système.

## Création d'un webmestre pour un site monsite.tld

Nous allons créer un utilisateur virtuel **admiweb** pour accéder par ftp au site **monsite.tld**, hébergé à l'emplacement **/var/www/html/monsite.tld**

Vérifiez l'existence de l'utilisateur **www-data** et de son groupe :

```
...@...:~$ id www-data
uid=33(www-data) gid=33(www-data) groupes=33(www-data)
```

→ L'identifiant du groupe **www-data** est **33**.

- Si le groupe **www-data** n'existe pas, créez-le ainsi que l'utilisateur **www-data** par :

```
...@...:~$ sudo groupadd www-data
...@...:~$ sudo useradd -g www-data -d /var/www -s /bin/false www-data
```

2. Créez un nouvel utilisateur virtuel ayant accès à **/var/www/html** (le webmestre **admiweb**, de home **/var/www/html**, avec les uid et gid de **www-data**, fournissez et confirmez le **mot de passe** du nouveau compte) :

```
...@...:~$ cd /etc/proftpd/
...@...:/etc/proftpd$ sudo ftpasswd --passwd --name admiweb --gid 33 --uid 33 --home /var/www/html --shell /bin/false
ftpasswd: creating passwd entry for user admiweb
...
Password:
Re-type password:
...
ftpasswd: entry created
```

## Création d'un utilisateur virtuel (cas général)

On peut créer de la même façon des utilisateurs virtuels ayant des identifiants quelconques (sauf UID 0 (zéro) et GID 0 (zéro) qui sont utilisés pour l'utilisateur root et le groupe root).

Utilisez pour les utilisateurs virtuels des identifiants qui ne sont pas déjà utilisés dans **/etc/passwd** pour séparer les privilèges de vos utilisateurs système de ceux de vos utilisateurs virtuels.

Les privilèges sont déterminés par les identifiants.

Les utilisateurs virtuels peuvent tous avoir les mêmes identifiants → ils auront tous exactement les mêmes privilèges.

La directive **DefaultRoot** ~ dans **/etc/proftpd/conf.d/global.conf** confine vos utilisateurs virtuels dans des répertoires personnels distincts.

Ainsi, ces utilisateurs virtuels, bien qu'ayant tous les mêmes privilèges, seront tous séparés dans des répertoires différents.

L'outil ftpasswd est un script Perl.

## Fichier de configuration

Créez ou éditez avec les droits d'administration le fichier **/etc/proftpd/conf.d/global.conf** pour ajouter à la fin votre configuration :

[/etc/proftpd/conf.d/global.conf](#)

```
# Tous les utilisateurs seront emprisonnés dans leur home, sauf
l'utilisateur système xxxxxxxx
DefaultRoot ~ !xxxxxxx

# Pas de shell valide exigé (ex : bin/sh ou /bin/bash).
RequireValidShell off

# Fichier des mots de passe
AuthUserFile /etc/proftpd/ftpd.passwd

# Fichier des groupes
AuthGroupFile /etc/proftpd/ftpd.group

AuthOrder mod_auth_file.c mod_auth_unix.c
AuthPAM off
```

Cas d'un Raspberry Pi :

[/etc/proftpd/conf.d/global.conf](#)

```
# Tous les utilisateurs seront emprisonnés dans leur home, sauf
l'utilisateur système pi
DefaultRoot ~ !pi

# Pas de shell valide exigé (ex : bin/sh ou /bin/bash).
RequireValidShell off

# Fichier des mots de passe
AuthUserFile /etc/proftpd/ftpd.passwd

# Fichier des groupes
AuthGroupFile /etc/proftpd/ftpd.group

AuthOrder mod_auth_file.c mod_auth_unix.c
AuthPAM off
```

Créez les fichiers **/etc/proftpd/ftp.passwd** et **/etc/proftpd/ftpd.group** :

```
...@...:~$ sudo touch /etc/proftpd/ftp.passwd
...@...:~$ sudo touch /etc/proftpd/ftpd.group
```

## Rechargement et test

Relancez proftpd et vérifiez que l'utilisateur admiweb peut se connecter :

Relancez proftpd et vérifiez que l'utilisateur admiweb peut se connecter :

```
...@...:~$ sudo systemctl restart proftpd
...@...:~$ ftp localhost
...
Name (localhost:xxxxxxx): admiweb
331 Mot de passe requis pour admiweb
Password:
230 Utilisateur admiweb authentifié
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> ls
...
-rwxrws---  1 admiweb  www-data      612 Apr 25  2018 index.nginx-
debian.html
...
ftp> bye
221 Au revoir.
...@...:~$
```

Pour un Raspberry Pi :

```
pi@framboise:~ $ sudo systemctl restart proftpd
pi@framboise:~ $ ftp localhost
Connected to localhost.
220 ProFTPD Server (Debian) [::1]
Name (localhost:pi): admiweb
331 Mot de passe requis pour admiweb
Password:
230 Utilisateur admiweb authentifié
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> ls
...
drwxrws---  22 admiweb  www-data      4096 Jul 28 13:23 html
...
ftp> bye
221 Au revoir.
pi@framboise:~ $
```

L'utilisateur système xxxxxxxx, lui, peut se connecter et n'est pas emprisonné :

```
...@...:~$ ftp localhost
...
Name (localhost:xxxxxxx):
331 Mot de passe requis pour xxxxxxxx
Password:
```

```
230 Utilisateur xxxxxxxx authentifié
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> ls
...
drwxrwxr-x  4 xxxxxxxx xxxxxxxx      4096 Sep  5 05:39 Bureau
...
226 Téléchargement terminé
ftp> cd ..
...
ftp> ls
...
drwxrwxr-x 269 xxxxxxxx xxxxxxxx     20480 Sep 10 11:51 xxxxxxxx
...
ftp> bye
221 Au revoir.
...@...:~$
```

Pour un Raspberry Pi :

```
pi@framboise:~ $ ftp localhost
...
Name (localhost:pi):
331 Mot de passe requis pour pi
Password:
230 Utilisateur pi authentifié
...
ftp> ls
...
drwxr-xr-x  2 pi      pi              4096 Sep  9 16:15 Desktop
...
ftp> cd ..
...
ftp> ls
...
drwxr-xr-x  33 pi      pi              4096 Sep  9 17:53 pi
...
ftp> bye
221 Au revoir.
pi@framboise:~ $
```

## Fichier proftpd.conf et dérivés

Il inclut :

- **/etc/proftpd/modules.conf**
  - Répertoire des modules DSO : /usr/lib/proftpd
  - Seul l'utilisateur root peut charger et décharger des modules, mais tout le monde

peut voir quels modules ont été chargés.

- Charge les modules mod\_ctrls\_admin.c, mod\_tls.c, mod\_radius.c, mod\_quotatab.c, mod\_quotatab\_file.c, mod\_quotatab\_radius.c, mod\_wrap.c, mod\_rewrite.c, mod\_load.c, mod\_ban.c, mod\_wrap2.c, mod\_wrap2\_file.c, mod\_dynmasq.c, mod\_exec.c, mod\_shaper.c, mod\_ratio.c, mod\_site\_misc.c, mod\_sftp.c, mod\_sftp\_pam.c, mod\_facl.c, mod\_unique\_id.c, mod\_copy.c, mod\_deflate.c, mod\_ifversion.c, mod\_tls\_memcache.c, mod\_ifsession.c

## 2. /etc/proftpd/conf.d/

3. (désactivés) :

- #/etc/proftpd/ldap.conf (entièrement désactivé par des #)
- #/etc/proftpd/sql.conf (entièrement désactivé par des #)
- #/etc/proftpd/tls.conf (entièrement désactivé par des #)
- #/etc/proftpd/virtuals.conf (entièrement désactivé par des #)

Après chaque changement de configuration, pensez à relancer proftpd :

```
$ sudo systemctl restart proftpd
```

## Sécurisation TLS

Le serveur est maintenant en place, cependant, tout ce qui transite entre votre serveur et votre Client FTP transite en clair sur le Net.

Nous allons chiffrer le tout avec une sécurisation TLS (SSLv3 étant deprecated).

Commençons par créer un certificat SSL auto-signé :

```
$ sudo openssl req -new -x509 -days 365 -nodes -out
/etc/ssl/certs/proftpd.cert -keyout /etc/ssl/private/proftpd.key

Generating a 2048 bit RSA private key
.....+++
.....
.....+++
writing new private key to '/etc/ssl/private/proftpd.key'
-----
You are about to be asked to enter information that will be
incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name
or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
```

```
-----  
Country Name (2 letter code) [AU]:FR  
State or Province Name (full name) [Some-State]:  
Locality Name (eg, city) []:  
Organization Name (eg, company) [Internet Widgits Pty Ltd]:  
Organizational Unit Name (eg, section) []:  
Common Name (e.g. server FQDN or YOUR name) []:sd-xxxxx.dedibox.fr  
Email Address []:me@mymail.tld
```

Renseignez les champs demandés avec les bonnes informations. (sd-xxxxx.dedibox.fr : votre nom de domaine si vous en avez un).

Protégez la clé :

```
$ sudo chmod 440 /etc/ssl/private/proftpd.key
```

Nous allons maintenant forcer notre serveur FTP à utiliser cette clé pour générer une connexion chiffrée.

Avec les droits d'administration, éditez le fichier **/etc/proftpd/conf.d/tls.conf** pour le modifier comme ceci :

[/etc/proftpd/conf.d/tls.conf](#)

```
<IfModule mod_tls.c>  
  TLSEngine on  
  TLSLog /var/log/proftpd/tls.log  
  
  # TLSv1 Uniquement  
  TLSProtocol TLSv1  
  
  # N'autorise que les connexions sécurisées  
  TLSRequired on  
  
  # Renseigne l'emplacement des certificats  
  TLSRSACertificateFile /etc/ssl/certs/proftpd.cert  
  TLSRSACertificateKeyFile /etc/ssl/private/proftpd.key  
  
  TLSVerifyClient off  
  TLSRenegotiate none  
  TLSOptions NoSessionReuseRequired  
  
</IfModule>
```

Redémarrez le serveur FTP :

```
$ sudo systemctl restart proftpd
```

Vous pouvez maintenant vous connecter à votre serveur FTP de manière sécurisée !

## Quelques exemples de fichiers de configuration

- **Basic :**

[Basic.conf](#)

[basic.conf](#)

```
# This is a basic ProFTPD configuration file (rename it
to
# 'proftpd.conf' for actual use. It establishes a single
server
# and a single anonymous login. It assumes that you have
a user/group
# "nobody" and "ftp" for normal operation and anon.

ServerName          "ProFTPD Default Installation"
ServerType          standalone
DefaultServer       on

# Port 21 is the standard FTP port.
Port                21

# Umask 022 is a good standard umask to prevent new dirs
and files
# from being group and world writable.
Umask               022

# To prevent DoS attacks, set the maximum number of child
processes
# to 30. If you need to allow more than 30 concurrent
connections
# at once, simply increase this value. Note that this
ONLY works
# in standalone mode, in inetd mode you should use an
inetd server
# that allows you to limit maximum number of processes
per service
# (such as xinetd).
MaxInstances        30

# Set the user and group under which the server will run.
User                nobody
Group               nogroup

# To cause every FTP user to be "jailed" (chrooted) into
their home
# directory, uncomment this line.
#DefaultRoot ~
```

```
# Normally, we want files to be overwriteable.
<Directory />
  AllowOverwrite      on
</Directory>

# A basic anonymous configuration, no upload directories.
# If you do not
# want anonymous users, simply delete this entire
# <Anonymous> section.
<Anonymous ~ftp>
  User                ftp
  Group              ftp

  # We want clients to be able to login with "anonymous"
  # as well as "ftp"
  UserAlias          anonymous ftp

  # Limit the maximum number of anonymous logins
  MaxClients         10

  # We want 'welcome.msg' displayed at login, and
  # '.message' displayed
  # in each newly chdired directory.
  DisplayLogin       welcome.msg
  DisplayFirstChdir  .message

  # Limit WRITE everywhere in the anonymous chroot
  <Limit WRITE>
    DenyAll
  </Limit>
</Anonymous>
```

- **Anonymous**

[anonymous.conf](#)

[anonymous.conf](#)

```
# This sample configuration file illustrates configuring
# two
# anonymous directories, and a guest (same thing as
# anonymous but
# requires a valid password to login)

ServerName          "ProFTPD Anonymous Server"
ServerType          standalone

# Port 21 is the standard FTP port.
Port                21
```

```
# If you don't want normal users logging in at all,
uncomment this
# next section
#<Limit LOGIN>
# DenyAll
#</Limit>

# Set the user and group that the server normally runs
at.
User          nobody
Group         nogroup

# To prevent DoS attacks, set the maximum number of child
processes
# to 30.  If you need to allow more than 30 concurrent
connections
# at once, simply increase this value.  Note that this
ONLY works
# in standalone mode, in inetd mode you should use an
inetd server
# that allows you to limit maximum number of processes
per service
# (such as xinetd)
MaxInstances          30

# Set the maximum number of seconds a data connection is
allowed
# to "stall" before being aborted.
TimeoutStalled       300

# We want 'welcome.msg' displayed at login, and
'.message' displayed
# in each newly chdired directory.
DisplayLogin         welcome.msg
DisplayFirstChdir   .message

# Our "basic" anonymous configuration, including a single
# upload directory ("uploads")
<Anonymous ~ftp>

# Allow logins if they are disabled above.
<Limit LOGIN>
  AllowAll
</Limit>

# Maximum clients with message
MaxClients           5 "Sorry, max %m users -- try
again later"

User          ftp
Group         ftp
```

```
# We want clients to be able to login with "anonymous"
as well as "ftp"
UserAlias          anonymous ftp

## Utilisation

Sur un PC du réseau, ouvrez Filezilla et lancez une connexion :

- Hôte : l'adresse IP du serveur (ici, un Raspberry)
- Identifiant : admweb
- Mot de passe : son mot de passe

Interface graphique : [Gadmin-ProFTPd](#) : une interface graphique pour le serveur FTP

ProFTPd 

## Désinstallation
